

Studies of TEC in Ecuador using Global Positioning System (GPS) data

David Andrade Éricson López

National Polytechnic School Quito Astronomical Observatory

What is the ionosphere? The ionosphere is a region of the upper atmosphere.

The ionosphere is a shell of electrons and electrically charged atoms and molecules around the Earth.

Why do we study the ionosphere?

The ionosphere has a role in the propagation of radio waves and in the propagation of interference from electrical-shock.

Frequencies < 30 MHz

Changes in the ionospheric parameters produce variations in the magnetic field and electromagnetic emissions

One of the most important parameter is the total electron content (TEC)

How do we study TEC?

It's introduced a delay for frequencies over 30 MHz.

We can study the total electron content (TEC), using GPS Data (pseudorange and carrier phase)

The TEC is affected by the solar activity 200 The ion concentration in this layer is affected by interactions with particles arising from the solar activity. 150 Parameters such as latitude, longitude, time, solar cycle, ground stations, and others influence the content of ions present in this region. 100 50 1995 2000 2005 2010 2015 2020

Quito

The ionospheric time delay is determined from simple ray optics using the first-order ionospheric index of refraction (Budden, 1961)

 $\mu = \sqrt{1 - f_p^2/f^2}$ where $f_p = \frac{e^2 n}{4\pi^2 \epsilon_0 m_e}$ is the plasma frequency. Then the ionospheric time delay is given by:

$$I = \int (1-\mu) \frac{ds}{c}$$
 (1)

7

For GPS frequencies, we have to $\frac{f_p}{f} \ll 1$.

Then

$$I = \int (1-\mu) \frac{ds}{c} \approx \frac{e^2}{8\pi^2 c\epsilon_0 m_e} \frac{1}{f^2} \int nds \approx \frac{1.345 \times 10^{-7}}{f^2} STEC$$
(2)

Formulation of the TEC measurement Where the slant sTEC is measured in TECU (1 TECU = 10^{16} e/m²)

If we multiply the expression (2) for "c" we obtained the ionospheric range delay.

$$d_{ion} = \frac{40.3}{f^2} sTEC \tag{3}$$

GPS pseudorange P_{kj}^{i} and carrier phase L_{kj}^{i} for two frequencies (k = 1 or 2) can be represented as follows:

$$P_{1j}^{i} = \rho_{0}^{i} + d_{ion1j}^{i} + c(\tau^{i} - \tau_{j}) + b_{q1}^{i} + b_{q1j} + b_{resj}^{i}$$
(4.1)

$$P_{1j}^{i} = \rho_{0}^{i} + d_{ion1j}^{i} + c(\tau^{i} - \tau_{j}) + b_{q1}^{i} + b_{q1j} + b_{resj}^{i}$$
(4.1)

$$P_{1j}^{i} = \rho_{0}^{i} + d_{ion1j}^{i} + c(\tau^{i} - \tau_{j}) + b_{q1}^{i} + b_{q1j} + b_{resj}^{i}$$
(4.1)

$$P_{1j}^{i} = \rho_{0}^{i} + d_{ion1j}^{i} + c(\tau^{i} - \tau_{j}) + b_{q1}^{i} + b_{q1j} + b_{resj}^{i}$$
(4.1)

$$P_{1j}^{i} = \rho_{0}^{i} + d_{ion1j}^{i} + c(\tau^{i} - \tau_{j}) + b_{q1}^{i} + b_{q1j} + b_{resj}^{i}$$
(4.1)

$$P_{1j}^{i} = \rho_{0}^{i} + d_{ion1j}^{i} + c(\tau^{i} - \tau_{j}) + b_{q1}^{i} + b_{q1j} + b_{resj}^{i}$$
(4.1)

$$P_{1j}^{i} = \rho_{0}^{i} + d_{ion1j}^{i} + c(\tau^{i} - \tau_{j}) + b_{q1}^{i} + b_{q1j} + b_{resj}^{i}$$
(4.1)

$$P_{1j}^{i} = \rho_{0}^{i} + d_{ion1j}^{i} + c(\tau^{i} - \tau_{j}) + b_{q1}^{i} + b_{q1j} + b_{resj}^{i}$$
(4.1)

$$P_{1j}^{i} = \rho_{0}^{i} + d_{ion1j}^{i} + c(\tau^{i} - \tau_{j}) + b_{q1}^{i} + b_{q1j} + b_{resj}^{i}$$
(4.1)

$$P_{1j}^{i} = \rho_{0}^{i} + d_{ion1j}^{i} + c(\tau^{i} - \tau_{j}) + b_{q1}^{i} + b_{q1j} + b_{resj}^{i}$$
(4.1)

$$P_{1j}^{i} = \rho_{0}^{i} + d_{ion1j}^{i} + c(\tau^{i} - \tau_{j}) + b_{q1}^{i} + b_{q1j} + b_{resj}^{i}$$
(4.1)

$$P_{1j}^{i} = \rho_{0}^{i} + d_{ion1j}^{i} + c(\tau^{i} - \tau_{j}) + b_{q1}^{i} + b_{q1j} + b_{q1j}^{i} + b_{resj}^{i} + b_{q1j}^{i} + b_{resj}^{i} + b_{q1j}^{i} + b_{q1j$$

Quito-Ecuador

$$P_{2j}^{i} = \rho_{0}^{i} + d_{ion2j}^{i} + c(\tau^{i} - \tau_{j}) + b_{q2}^{i} + b_{q2j} + b_{resj}^{i}$$
(4.2)

The carrier phases $L_{1j}^i = \lambda_1 \phi_{1j}^i$ and $L_{2j}^i = \lambda_2 \phi_{2j}^i$ are expressed in range.

carrier wavelength other biases of noise and multipath
$$L_{1j}^{i} = \rho_{0j}^{i} - d_{ion1j}^{i} + c(\tau^{i} - \tau_{j}) - \lambda_{1}N_{1j}^{i} + B_{q1j} + B_{resj}^{i}$$
 (4.3)
the integer numbers of the carrier phase.

$$L_{2j}^{i} = \rho_{0j}^{i} - d_{ion2j}^{i} + c(\tau^{i} - \tau_{j}) - \lambda_{2}N_{2j}^{i} + B_{q2j} + B_{resj}^{i}$$
(4.4)

9

Combining equations (4.1) and (4.2), equations (4.3) and (4.4) respectively with equation (3), we obtain that:

$$sTEC = \frac{1}{40.3} \left(\frac{f_1^2 f_2^2}{f_1^2 - f_2^2} \right) \left(P_{2j}^i - P_{1j}^i - b^i - b_j + \varepsilon_p \right)$$
(5)
$$sTEC = \frac{1}{40.3} \left(\frac{f_1^2 f_2^2}{f_1^2 - f_2^2} \right) \left(L_{1j}^i - L_{2j}^i - B^i - B_j + \lambda_1 N_{1j}^i - \lambda_2 N_{2j}^i + \varepsilon_L \right)_{arc}$$

(6)

Where
$$b^i = b^i_{q2} - b^i_{q1}$$
; $b_j = b_{q2j} + b_{q1j}$.

$$B^{i} = B^{i}_{q2} - B^{i}_{q1}; B_{j} = B_{q2j} - B_{q1j}.$$

The "leveling carrier to code" algorithm is widely used to reduce the ambiguities from the carrier-phase observable. We define:

$$L_I = L_1 - L_2 \tag{7}$$

$$\boldsymbol{P}_{I} = \boldsymbol{P}_{2} - \boldsymbol{P}_{1} \tag{8}$$

By combining Eqs. (5) and (6) above, then by using the mean operator over an arc, we get:

$$\langle L_{I,arc} - P_I \rangle_{arc} = \lambda_1 N_{1j}^i - \lambda_2 N_{2j}^i + B_j - b_j + B^i - b^i - \langle \varepsilon_p \rangle_{arc}$$
 (9)

We obtain the mean value of the differences between two direct measurements by computing their differences for every continuous arc:

The effect of additional noise and multi-path on carrier-phase observations was neglected because it is very small compared to the effect of those for the code-delay observations.

Subtracting Eq. (9) from LI in the same arc, we can remove the integer ambiguity terms.

$$\widetilde{L}_{I,arc} = L_{I,arc} - \langle L_{I,arc} - P_I \rangle_{arc}$$
(10)

Finally, by the so called, "carrier to code leveling process", we obtain precise measurements for sTEC:

$$sTEC = \frac{1}{40.3} \left(\frac{f_1^2 f_2^2}{f_1^2 - f_2^2} \right) \left(\widetilde{L}_{I,arc} - b_j - b^i - \langle \varepsilon_p \rangle_{arc} + \varepsilon_L \right)$$
(11)

Vertica Total Electron Content vTEC

$$vTEC = sTECx \frac{\sqrt{\left(R_e + h_{pp}\right)^2 - R_e^2 \cos^2 \alpha}}{R_e + h_{pp}}$$

 R_e = earth's radius

 h_{pp} = is the chosen height of the ionospheric pierce point (300 Km)

 \propto = is the elevation angle of the ray

Conclusions

Due to solar activity in this epoch the TEC reaches very high values.

The Total Electron Content (TEC) in the equatorial region reaches high values, with a maximum of 85.532 TECU.

For two days analyzed we observe that the TEC changes very quickly, with a difference of 1.555 TECU ; 40 minutes 30 seconds and 1.528 TECU; 4 hours 30 minutes for maximum and minimum values respectively.
